Q	Answer	M	Partial Marks	Guidance
22	Correctly eliminating one variable	M1		Do **not** allow a sign misread e.g. –17 written as 17 is **M0** If there is a method for each variable, mark the **better** method. Allow one arithmetic error (**not** a sign error) in whichever method you are marking: Elimination: **M1** implied by $14kx = -42k$ or $28ky = 112k$ Substitution: **M1** given when this stage is reached: e.g. $3((9-6y)/5) - 2y = -17$ Rearranged and equated: **M1** when the two rearrangements are equated. See AG for Cramer's Rule
	$x = -3$ $y = 4$	A1 A1	If **A0** scored, **SC1** for 2 values satisfying one of the original equations.	This means a score of **M1 A0 SC1** is possible **SC1** for 2 values on the answer lines that substitute to give $5x + 6y$ rounding to 9.00 e.g. (0, 1.5), (-15, 14) or $3x - 2y$ rounding to -17.0 e.g. (2, 11.5), (-4, 2.5) or **SC1** if no working or wrong working but 2 correct answers given. **TE** for answers $x = -3$ and $y = 4$ correct in working but reversed on the answer line.
